Leandro F. Juárez · Project

splunk-mcp-readonly

I developed it myself as an open-source project, with the objective of letting an AI assistant query Splunk with no risk of writing, deleting or executing anything.

The problem

An AI assistant that can explore Splunk is useful; one that can run `| delete` or `| outputlookup` on a typo or a prompt injection is an incident. splunk-mcp-readonly is a standalone, read-only MCP server that lets Claude Desktop, Claude Code or any MCP client query Splunk Enterprise and Splunk Cloud with nothing but a token, without installing anything on the customer's Splunk: it runs on the consultant's, auditor's or analyst's side and only needs the management port.

In detail

It exposes seven read-only tools (search, SPL validation without running it, indexes, saved searches, server info, health and Enterprise Security notables) behind a guard that refuses any command that could write, delete, export or execute, forces a row cap and a default time range, applies an index allow-list and writes a JSON Lines audit log of every call. Safety is enforced twice: by the server and by a least-privilege Splunk role behind the token.

About 800 lines of Python you can review in an hour, 83 offline tests, MIT licensed.
